INTRODUCTION

This section provides general descriptions, guidelines, and recommendations for all of the components found in this catalog. Design descriptions and explanations are provided to assist you in selecting the correct tooling for the job.

BIT TYPES

Button Bit

- Fast penetration
- More adaptable to different types of ground conditions, due to the different configurations of designs and buttons available

Blade Bit

- Maintains hole diameter with reduced gauge wear
- Reduces hole deviation
- Different types of carbides for different ground conditions

BIT TYPES

Button Bit Components

Special Skirt Designs

- Cutting edges in skirt for easy removal of bit in adverse hole conditions

Straightrac Bit

- Angled flute design for 360 degrees of contact, reducing the hole deviation
- Cutting edges in skirt

BIT FACE DESIGNS

BR - Button Recessed

“Drop Center” face characteristic

- Reduced hole deviation
- Broken ground conditions

BF - Button Flat

“Flat” face characteristic

- General purpose bit
- Hard to medium conditions

BC - Button Chisel

Chisel shape characteristic

- Abrasive conditions
- Fast penetration

BD - Button Dome

- Clearly defined raised face profiles
- Primary reaming applications in soft ground

BUTTON TYPES

Hemispherical Button

- Best suited for hard ground
- 25,000 to 45,000 PSI (170 to 300 MPa)
- Abrasive to very abrasive

Parabolic Button (Semi Ballistic)

- Fast penetration
- Best suited for medium ground
- 15,000 to 25,000 PSI (100 to 170 MPa)
- Mildly abrasive ground

Conical Button

- Application Strength – fast penetration
- Suited for all non-abrasive ground types
- Smaller contact area
- Best suited for smaller diameter bits

Ballistic Button

- Fast penetration
- Suited for all non-abrasive ground types
- Smaller contact area
- Best suited for smaller diameter bits

BLADE BIT DESIGNS

Blade bit designs are limited to cross and “X” type face configurations.

- 32 mm to 57 mm are restricted to a cross configuration.
- 57 mm or larger usually have an ‘X’ configuration.

In special circumstances, blade bits are preferred.

- Blade bits tend to resist gauge wear better than button bits.
- Hole accuracy is required and very hard, abrasive ground is encountered.

Cross Bits

- Easier to sharpen than X-bits, inset angles are equal on all four sides
- Bits 64 mm and less are easier to sharpen than button bits of the same size.
- In certain rock conditions, cross bits tend to produce a spiraled five sided hole (especially in diameters larger than 64 mm).

“X” Bits

- X-bits tend to drill round holes in all rock conditions.
- The steel support in the narrow parts of the X becomes inadequate in X-bits smaller than 64 mm because of the restricted circumference.

REAMING TOOLING DESIGNS

Reaming Bits or Hole Openers

Description

- Pilot holes are drilled to depth and then reamed out to a larger diameter in a second pass.
- Required when hole diameter exceeds the capabilities of the rockdrill and drilling tools available

Applications

- Large diameter service holes from level to level for drainage, electrical cable or pipe lines
- Reaming cut holes for development rounds and for long hole blasting of drop raises

US Patent No. 9,784,038; Patent pending

Button Bit Reamer - One Piece Bit

- Has an integral pilot on the face of the reamer

Button Bit Reamer - One Piece Bit - Dome

Pilot Adapter/Reamer - Two-Piece System

- The reaming assembly is made of a 6° tapered pilot adapter that threads on the lead steel with a taper socket reaming bit fitted on the pilot.

Razorback

- Cutting teeth on the back side of the reamer significantly reduces the time required to pull a drill string in broken ground conditions by maintaining cutting fluidity.

ROD TYPES

Round Rods

- Normally used in extension drilling applications
- Generally lighter than hexagonal rods of an equivalent size
- Available in large x-sectional diameters
- Diameter of rod is based on external dimension

Hexagon Rods

- The cross sectional dimension of material is measured across the flat.
- Cross sections are more rigid, heavier & transfer energy more efficiently.
- Reduces the annulus in the drill hole for better flushing.
- Smaller space combined with the corners of the steel create turbulence in the hole, keeps the heavier cuttings moving, especially with horizontal holes.
- The rigidity of the cross section makes it possible to use a larger thread.

Carburization

- Entire rod is hardened providing a case over the entire rod surface both internal and external.
- Primarily used in underground applications and where water is used as a flushing medium

High Frequency (H/F) Induction

- Only the thread ends of the rod are hardened
- Primarily used in surface drilling applications where air is the primary flushing medium

THREAD TYPES

R Thread (Rope)

- Rope threads — low pitch, 12.7 mm and a small angle of profile
- Sizes: 22 mm – 38 mm
- Good wear properties
- Ideal for single pass or shorthole drilling such as underground tunneling applications that require infrequent uncoupling

HM (T) Thread

- HM thread or “T” thread — larger pitch and a larger angle of profile than the Rope thread
- Sizes 35 mm, 38 mm, 45 mm and 51 mm
- Excellent wear properties and good coupling qualities
- Ideal for extension drilling with multiple steel
- Greater torque capacity

EL Thread

- Similar angle of profile to the HM thread
- Designed for a 60 mm and 70 mm diameter extension steel for use with the new generation high powered rockdrills
- Excellent wear resistance and a pitch angle that uncouples easily

BE (ST) Thread (Tube Rod)

- Thread is a shoulder drive system (available in bottom drive as well). The shoulders on the pin and box butt together to transmit the energy.
- Excellent wear properties and good coupling qualities
- Used in extension tube drilling with multiple tube steels.
- Compatible with high-torque top hammer rockdrills for surface and underground applications

COUPLING TYPES

Semi-Bridge Coupling

- Small non-threaded bridge in the center
- Steel cannot thread past bridge area
- Smaller diameter steel end portions fit together in the center bridge area of the coupling
- Semi-bridged couplings are most suited to high-torque machines
- Most rope and HM threaded couplings are semi-bridged
- Best energy transfer

Full-Bridge Coupling

- Eliminates the potential for the coupling to creep along the threaded joints
- Typically used in surface applications
- Better uncoupling characteristics and tends to maintain tighter joints
- Less chance of jamming
- Best suited to machines equipped with independent rotation (ie., S36IR rockdrill)

Adapter Coupling

- Use when changing from one thread type or size to another and are typically required only in special circumstances

SHANK ADAPTERS/STRIKING BARS

Hydraulic and Pneumatic Shanks

- Male shank adapters are generally better suited for drifting, tunneling & extension applications where high bending stresses are present.
 - Female shank adapters are used when the drilling space is limited and the total feed length is important (i.e., underground roof bolting).
- Two flushing options, internal or external:
- Internal flushing uses a water tube that fits through the centre of the drill and into an o-ring seal in the end of the shank, to transfer flushing into the drill string.
 - External flushing, holes or a slot are required in the side of the shank adapter. These line up between seals inside the front head or water box of the rockdrill when the shank is installed. Flushing medium is supplied directly to this device and is introduced into the drill string through the shank.
- External flushing is considered superior to internal flushing as greater volumes of flushing agent can be delivered with less risk of leakage and hammer damage from water.
 - The shanks for hydraulic drills and some pneumatic drills have external or front head flushing. Hydraulic shanks generally have at least 5 to 14-spline configuration.
 - Pneumatic shanks tend to have internal or through flushing and can generally be identified by their lugs or 4-spline configuration.

RST™ SERIES RODS AND BITS

OVERVIEW

Strength Defined

Boart Longyear has a long history of providing premium Rock Drill and Blast Drilling products for the most demanding conditions. This tradition continues with the introduction of the Robust Standard Thread (RST™) Series percussive rods and bits with industry leading strength and penetration rates. Boart Longyear has responded to industry demands for stronger, more versatile percussive rods and bits by developing the RST Series that incorporates a larger cross-sectional transition area as well as an increased bit skirt length. This delivers improved impact efficiency for faster penetration rates, increased rod tip-off resistance, and less hole deviation.

Superior Productivity and Design

The RST Series rods incorporate a larger cross-sectional transition area for a nearly 45% increase in bending strength. The bit skirt is also extended for improved interface, making rod tip-off events less likely and reducing cost and downtime. The design of the RST Series results in straighter and truer holes with penetration rate increases of up to 20% as compared to a competitive design offering.

Interchangeability

As an additional benefit, the RST Series design allows for interchangeability with standard rods and bits for improved flexibility in the field, unlike the competitive offerings which utilize unique thread designs.

1 LARGER CROSS-SECTIONAL TRANSITION AREA

Increased rod rigidity/strength when used in deviated applications such as scaling. This results in decreased rod tip-offs and increased productivity

2 UNIVERSAL THREAD

Designed to be compatible with both RST™ Series R32 and existing standard R32 products

3 EXTENDED BIT SKIRT

Provides straighter holes with reduced deviation

4 RETRACT OR STRAIGHT TRACK BIT DESIGN (OPTIONAL)

Provides a cleaner, straighter hole as well as easier bit removal in varied ground conditions

5 PREMIUM TUNGSTEN CARBIDE BUTTONS

Delivers extended drilling performance and longer durability by increasing toughness and wear-resistant properties

6 PREMIUM BODY STEEL MATERIAL

Reduces face and body wear and provides uniform wear characteristics, improved button retention and efficient energy transfer

LIGHTNING ROD™ SERIES

Fast Productivity

Boart Longyear has built its reputation by providing innovative Rock Drill and Blast products for specific customer needs. The introduction of our Lightning Rod™ Series for the Surface Drill and Blast percussive market continues this tradition. In response to industry demands, the Lightning Rod Series provides a quick-change male/female rod with high-durability and air flushing. These rods are designed specifically for the surface drill and blast market by focusing on the quick-change properties of male/female configurations and fully treated end-form with a premium steel mid-body. This creates easy coupling and uncoupling, carousel storage and loading, and air flushing. The result is higher productivity and improved efficiency.

Strength Where It Counts

The Lightning Rod Series of Surface Drill and Blast Products utilizes high-strength steel coupled with high-wear resistant ends. The male and female end forms are fully treated to provide market-leading wear resistance during both the drilling process as well as coupling and uncoupling events. Galling, chipping, and surface damage are minimized. The mid-body is comprised of premium steel that has been optimized for maximum air flushing. The Lightning Rod Series also delivers optimum rod compliance for the full range of ground conditions.

Quick to Change

The design configuration of the Lightning Rod Series is a male/female layout that requires no additional coupling. This allows for faster additions or removals to the drill string. The absence of a traditional coupling and optimal geometry is designed for use in top-hammer rod carousel storage and loaders. A wide range of diameters from 33 mm to 60 mm, and lengths from 8 ft to 14 ft provides customers the right size combination for specific project needs.

© Copyright 2015 Boart Longyear. All rights reserved. Patents pending.

1 MALE/FEMALE END THREAD FORMS

Eliminates conventional coupling to allow quick, automated subtractions and additions to the drill string

2 TREATED MALE AND FEMALE ENDS

High wear resistance and durability

3 PREMIUM MID-BODY STEEL

Designed for air flushing and optimal rod compliance, the mid-body's structure is strong and durable with efficient energy transfer

4 WIDE RANGE OF SIZES AND THREAD FORMS

Selected to cover multiple project specific needs

The technical drawings show five different shank adapter designs. Each drawing includes a front view of the adapter with its overall length L, width at the shank, and height. A detailed side view shows the shank's profile with a shoulder height of 38 mm, a shoulder width of 74 mm, and a body height of 38 mm. A separate detail shows a gear with a diameter of 54 mm and a bore diameter of 10 mm.

TROUBLESHOOTING

Collared and Tapered Rods 104
Blade Bits 106
Button Bits 107
Couplings 110
Shank Adapter 111
Drill Steels 113

COLLARED AND TAPERED RODS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 1 Mushrooming of striking end	i) Worn chuck bushing	i) Replace worn bushing
	ii) Dished piston	ii) Replace worn piston
	iii) Worn tappet or tappet bushing	iii) Replace tappet and/or bushing
POSITION - 2 Failure at beginning of shank end	i) Worn chuck bushing	i) Replace worn bushing
POSITION - 3	i) High polish generated by chuck bushing. Lack of lubrication or excessive flushing water pressure	i) Check operation pressures - lubrication, water and air pressure
	ii) Worn bushing	ii) Replace worn bushing
POSITION - 4 Breakage at beginning of collar radius	i) Poor chuck bushing radius causing indentation of the collar	i) Replace worn bushing
	ii) Overheating due to lack of lubrication	ii) Proper lubrication
	iii) Misalignment due to excessive play in bushing	iii) Replace worn bushing
POSITION - 5 Broken in bar	i) Normally associated with rod alignment	i) Keep rod alignment as close as possible
POSITION - 6 Shank wear or coke bottle wear	i) Worn chuck bushing	i) Replace worn bushing

COLLARED AND TAPERED RODS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 1 Breakage at beginning of taper radius	i) Worn bit socket ii) Improper reconditioning of rod taper iii) Using a damaged bit with a ridge or lip within the socket	i) Discard bit ii) Replace or recondition drill steel iii) Discard bit or ream out ridge
POSITION - 2 Breakage at end of taper radius	i) Worn bit socket ii) Improper reconditioning of rod taper iii) Using a damaged bit with a ridge or lip within the socket	i) Discard bit ii) Replace or recondition drill steel iii) Discard bit or ream out ridge
POSITION - 3 Breakage at bar	i) Normally associated with rod alignment	i) Keep rod alignment as close as pos- sible

BLADE BITS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 1 Insert corner fractured	i) Pinching in the hole by drilling into hole that was drilled with a smaller bit ii) Overdrilling - excessive gauge wear iii) Improper bit sharpening	i) Colour code bits by size to reduce opportunity for negative gauge clearance. Drill with the bit with the largest gauge thread reducing to smaller. ii) Resharpening bit when corner wear is no greater than 4.76 mm (3/16") iii) Resharpen bit to its original shape. Follow proper bit sharpening procedures
POSITION - 2 Insert detached from slot	i) Braze failure - fatigue of braze material	i) Review drilling practice, resharpening
POSITION - 3 Insert shattered	i) Overdrilling - excessive gauge wear ii) Incorrect grade of carbide iii) Overheating bit when resharpening iv) Insufficient flushing	i) Resharpen bit when wear flat no greater than 3.175 mm (1/8") ii) Utilize heavy duty grade iii) Resharpening bit to its original shape. Follow proper bit sharpening procedures iv) Increase flushing pressure
POSITION - 4 Skirt wring off	i) Improper or worn taper ii) Drilling with broken taper	i) Utilizing a taper gauge, check taper angle ii) Remove drill steel from circuit and refurbish
POSITION - 5 Skirt split	i) Improper or worn taper	i) Utilizing a taper gauge check taper angle
POSITION - 6 Traverse crack	i) Carbide grade too hard	i) Select bit with a softer, more tough grade of carbide
POSITION - 7 Longitudinal cracks	i) Overdrilling - excessive flat	i) Resharpen bit when wear flat no greater than 3.175 mm (1/8")

BUTTON BITS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 1 Body wash	i) Inadequate bailing	i) Check to ensure that maximum available flushing is employed. If bailing appears to be inadequate, try cleaning holes thoroughly after drilling each steel length. Continued drilling with poor bailing will wear bit bodies excessively
	ii) Drilling and excessive hole cleaning in loose and fractured material	ii) Do not use new bits in these applications. Use bits approaching the end of their usable life. Bits with missing buttons unsuitable for regular drilling can still be suitable for soft or broken ground conditions
POSITION - 2 Split skirt	i) Bit loose on rod	i) Do not engage percussion until bit is seated on rod
	ii) Hammering on bit to break connection	ii) Loosen bit while seated firmly on face or at bottom of the hole
POSITION - 3 Wring off	i) High rotation torque applied to stuck bit	i) Apply minimal amount of hammer pressure to free bit before increasing rotation pressures
	ii) Corrosion	ii) Inspect thread socket for pitting and rust
	iii) Breaking connection by hammering on bit	iii) Loosen bit while seated firmly on face or at bottom of the hole

BUTTON BITS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 4 Lost gauge button	i) Dry firing ii) Excessive bit body reduction through erosion from poor flushing or excessive bit body grinding iii) Scaling with bit iv) Interference too low when button fitted	i) Do not engage full percussion unless the bits are seated firmly against solid material. Use reduced percussion when collaring on uneven surfaces if the bits hang up in the hole and when racking the drill string to loosen connections ii) Ensure the drill cuttings are adequately bailed. Avoid drilling in broken and fractured material where excessive hole cleaning or back drilling is required. Remove only the amount of body required to restore proper button protrusion while grinding iii) Use proper scaling tools iv) Forward for analysis
POSITION - 5 Shattered buttons	i) Overdrilling ii) Drilling into metal iii) Forceful rotation in undersize holes, in broken material or through voids in the rock iv) Snake skin fatigue from extended drilling in non-abrasive material	i) 90% of all button failures are the direct result of continuing to drill with excessive wear flats on the buttons! Remove and service bits once the wear flat on any button reaches 1/3 of the face button diameter. Restore the button profile and protrusion as recommended in the bit sharpening guide before continuing use ii) Even new buttons will break when encountering foreign material like stuck steel, bits, rebar or any other metals trapped in the rock iii) Check that bit diameters are smaller than the hole before attempting to clean or deepen a hole under these conditions. Do not force bits if jamming occurs. Retract until rotating freely then advance slowly with moderate rotation. If this fails, use a scrapped bit or grind down the gauge buttons of the bit to reduce the diameter sufficiently to pass or remove the obstruction iv) Over drilling in soft non-abrasive material leaves a shiny surface on the buttons. Under magnification, a network of microscopic cracks can typically be found. Regularly inspect the bits and re-profile the buttons to remove these cracks from the surface of the carbides once the skin on the carbides starts to show

BUTTON BITS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 6 Sheared buttons above or below the bit body	i) Forceful rotation against intrusions, in broken material or through voids in the rock	i) Jerky rotation and stalling indicates obstructions in the hole. Do not force bits if this occurs. Retract the string until free rotation is restored. Then advance slowly with moderate rotations until obstacle is passed or removed. If this fails, use scrapped bits, a smaller diameter bit or grind down the gauge buttons of the bit to reduce the diameter sufficiently to pass or remove the obstruction
	ii) Poor collaring	ii) First, ensure mast is secure. Start collar then full pressure once bit is embedded 300 mm (12.0") in the rock
	iii) Excessive button protrusion through incorrect sharpening	iii) Protrusions greater than 3/4 of the button diameter will not provide sufficient support to resist the tensile forces that the buttons may encounter
	iv) Deformation of the upper portion of the button hole. Possible overheating of the bits through improper use	iv) The bit body temperature during drilling can reach 200° C (392° F) reducing retention force significantly
POSITION - 7 Split button	i) Overdrilling	i) 90% of all button failures are the direct result of continuing to drill with excessive wear flats on the buttons. Remove and service bits once the wear flat on any button reaches 1/3 of the face button diameter. Restore the button profile and protrusion as recommended in the bit sharpening guide before continuing use
POSITION - 8 Button wear 1/3 diameter	i) Normal button wear	i) Resharpen button and restore to original profile
POSITION - 9 Snake skin, shiny-polished appearance	i) When drilling in non-abrasive rock, microfractures develop in carbide	i) Resharpen bits frequently even if no visible wear is evident

COUPLINGS

TROUBLESHOOTING

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 1 Mushrooming of end	i) Hammering on the centralizer	i) Utilize a breakout plate
POSITION - 2 Coupling end is chipped, cracked and/or flared	i) Drill rod not firmly seated into the coupling from mismatch of threads	i) It is important to standardize on single source supplier for components to ensure proper thread tolerance. Do not "mix & match"
	ii) Mixing old thread components with new	ii) Install new couplings with new drill steels
	iii) Misalignment of feed	iii) Service affected equipment
	iv) Previous overheating of coupling	iv) The maximum running temperature for couplings is 182° C (276° F)
	v) Improper heat treatment	v) Forward for analysis
	vi) Dropping steel when retracting on upholes	vi) Use rockdrill with shank thread engaged to lower steel
	vii) Starting percussion or rotation with end of the shank resting against the end of the coupling	vii) Do not engage percussion or rotation if shank thread end is not aligned inside coupling
POSITION - 3 Failure across thread section	i) Hole deviation or misalignment of the feed in relation to the hole direction	i) Employ straight hole drilling devices
	ii) Low feed pressure	ii) Monitor feed force and tune to conditions
	iii) Heavy rotational loads from drilling with dull bits	iii) Resharpen bits when the wear flats appear 1/3 dull or discard when carbide profile height is compromised
	iv) Surface layer of steel compromised by a nick or dent	iv) Avoid hammering on connection. Use a breakout plate to loosen joints. Employ proper care and handling
POSITION - 4 Pitting or galling in the threads	i) Unused blow energy being reflected and absorbed	ii) Adjust percussion and feed pressures to rock conditions
	ii) Drilling with dull bits	ii) Resharpen bits when the wear flats appear 1/3 dull or discard when carbide profile height is compromised
POSITION - 5 Split coupling	i) Drilling with worn threads	i) Replace couplings more frequently
	ii) Excessive feed pressure	ii) Monitor feed force and tune to conditions

SHANK ADAPTERS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 1 Impact marks, chipped corners, mushroomed end	i) Misalignment due to worn bushings ii) Damaged piston	i) Replace worn components ii) Replace worn components
POSITION - 2 Failure approx. 25 mm (1.0") from strike face	i) Worn chuck driver ii) Fatigue starting at water seal recess	i) Replace worn components ii) Forward for analysis
POSITION - 3 Failure at top of splines	i) Lack of lubrication ii) Excessive feed force iii) Worn chuck driver or front bushing	i) Grease rockdrill regularly ii) Monitor coupling temperatures and adjust feed pressure according to recommendations iii) Replace worn components
POSITION - 4 Failure across splines	i) Worn chuck driver ii) Heavy rotational torque iii) Lack of lubrication iv) Overdrilling bits excessive wear flats and insufficient button protrusion v) Inadequate feed force	i) Replace worn components ii) Adjust drilling pressures iii) Grease rockdrill regularly iv) Resharpen bits when the wear flats appear 1/3 dull or discard when carbide profile height is compromised. Inspect bits and select only bits with adequate protrusion and proper button profile for most cost effective drilling. v) Monitor coupling temperatures and adjust feed pressure according to recommendations
POSITION - 5 Wear on bottom of spline shoulder	i) Excessive rotation while retracting string	i) Adjust drilling pressures
POSITION - 6 Failure at bottom of splines	i) Excessive rotation while retracting string	i) Adjust drilling pressures
POSITION - 7 Failure at fronthead	i) Misalignment from worn front bushing ii) Lack of lubrication	i) Replace worn components ii) Grease rockdrill regularly
POSITION - 8 Failure above threads	i) Misalignment of drill feed while drilling ii) Hole deviation iii) Excessive feed force	i) Utilize alignment tools to monitor hole orientation once the hole has been collared. Replace wear pads on feed ii) Employ straight hold drilling devices or systems iii) Monitor coupling temperatures and adjust feed pressure according to recommendations

SHANK ADAPTERS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 9 Failure in main body of threads	i) Mismatched threads ii) Lack of lubrication iii) Too much play in coupling. Shank Adapter improperly joined in coupling as a result of a thread wear iv) Excessive rattling	i) Use only certified original Boart Longyear component from authorized or licensed manufacturers ii) Grease rockdrill regularly iii) Replace worn components. Do not put a worn coupling on a new rod. Change out couplings with new shank adapters iv) Avoid extensive rattling. Boart Longyear threads are designed for easy uncoupling. If connectors do not loosen freely, inspect the threads. Probably causes of tightly threaded connections are: (1) dull bits; (2) worn or tight-fitting threads on steel or couplings; (3) incorrect or tight-fitting threads; and (4) insufficient or ineffective thread grease.
POSITION - 10 Failure close to bottom of thread	i) Excessive percussive pressure ii) Broken drill steel iii) Worn coupling	i) Monitor coupling temperature during drilling; adjust percussive pressures ii) Replace drill steel iii) Replace worn components. Do not put a worn coupling on a new rod. Change out your couplings with new rods
POSITION - 11 Chipped thread end	i) Shank Adapter not properly coupled to drill steel ii) Broken drill steel iii) Shank Adapter dropped into coupling	i) Replace damaged or worn couplings ii) Replace drill steel iii) Inspect feed for misalignment
POSITION - 12 Pitting and galling on threads	i) Overdrilling bit. Excessive wear flats and insufficient butt protrusion ii) Lack of lubrication iii) Inadequate feed force	i) Resharpen bits when the wear flats appear 1/3 dull or discard when carbide profile height is compromised. Inspect bits and select only bits with adequate protrusion and proper button profile for most cost effective drilling ii) Grease rockdrill regularly iii) Monitor coupling temperatures and adjust feed pressure according to recommendations
POSITION - 13 Pitting and galling on splines	i) Lack of lubrication ii) Excessive rotation in soft or broken ground	i) Grease rockdrill regularly ii) Adjust drilling pressures
POSITION - 14 Excessive wear on top of spline shoulder	i) Excessive feed force ii) Lack of lubrication	i) Monitor coupling temperatures and adjust feed pressure according to recommendations ii) Grease rockdrill regularly

DRILL STEELS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 1 Characterized by a fatigue rose origination from the outer surface. Surface layer of steel compromised by a nick or dent.	i) Surface damage caused by worn out centralizer bushings or steel bushings ii) Using a hammer on a stuck steel iii) Improper care and handling	i) Replace centralizer if diameter is 5 mm (1/2") larger than the drill steel ii) Use a rod wrench to twist the stuck steel to loosen iii) Store rods in a rod rack when retracting drill string. Do not drop rods
POSITION - 2 Characterized by a fatigue rose originated in the bore	i) Corrosion ii) Corrosion caused by brine and other corrosive flushing agents iii) Improper corrosion treatment during manufacturing	i) Evaluate proper storage practices are being followed ii) Change out components more frequently or neutralize flushing agent iii) Forward for analysis

DRILL STEELS

FAILURE	PROBABLE CAUSE	RECOMMENDED ACTION
POSITION - 1 Failure occurs where coupling ends or above the thread radius. Typically a sudden failure	i) Wandering or drifting hole ii) Worn threads and/or coupling. Migrating coupling (bridge worn out) iii) Bending due to overfeeding iv) Bending due to misalignment v) Excessive rotation during rod retraction vi) Heavy rotational loads caused by drilling with a dull bit and increased reflected stress vii) Drilling in voids, seams and/or broken conditions viii) Continued percussion when drill steel jams in void or seam	i) Employ straight hole drilling devices or systems ii) Replace worn components. Do not put a worn coupling on a new rod. Change out your couplings with new rods iii) Monitor feed force and tune to rock conditions iv) Utilize alignment tools to monitor hole orientation once the hole has been collared. Replace wear pads on feed v) Adjust drilling pressures vi) Resharpen bits when the wear flats appear 1/3 dull or discard when carbide profile height is compromised vii) Adjust drilling pressures and tune to rock conditions viii) Use drill with anti-jam features. Reduce feed and percussion pressure
POSITION - 2 Fatigue through high surface tensile or shear stress, occurring 1/3 the way into the threads	i) Worn threads or surface galling ii) Surface layer of thread damaged by a nick or dent caused by improper care and handling	i) Replace worn components ii) Store rods in a rod rack when retracting drill string. Do not drop rods
POSITION - 3 Chip broken off end of drill steel	i) Too much play in coupling. Drill steels improperly joined in coupling as a result of a thread or bridge wear ii) Hammering end of steel on coupling	i) Replace worn components ii) Use a breakout plate to loosen joints
POSITION - 4 Galling in the threads and excessive heat (color change to blue)	i) Unused energy from percussive blow being reflected backwards to the drilling machine ii) Drilling with dull bits	i) Adjust drilling pressures and tune to rock conditions ii) Resharpen bits when the wear flats appear 1/3 dull or discard when carbide profile height is compromised

BIT WEAR OVERVIEW

Sharp Bit

The percussive energy transferred into the rock is optimized, large rock chips are produced and the penetration rate is maximized.

Flats Developing

As flats develop on the buttons (tungsten carbide inserts), energy utilization is no longer optimized, leading to a lower penetration rate and reduced productivity. As buttons wear, the bit is less effective at fracturing the rock and the energy is dispersed over a larger surface area. Instead, rock is ground, rather than cut, producing smaller cuttings and energy (no longer used for breaking virgin rock) is reflected back up the drill string. This reflective energy contributes to increased loads on the tooling, drifter, and rig. As a general guideline, refurbishing the buttons before the flats reach 1/3 of the button diameter will maintain penetration/productivity, provide maximum bit utilization and help extend the life of all drill string components.

Excessive Wear

If the button flats are allowed to develop further to where they are considered over-drilled, productivity and the rate of penetration deteriorates. In this situation, much of the rock in contact with the buttons is re-drilled and the steel bit face may make contact with the bottom of the hole. Fewer and smaller rock chips are produced and much of the energy is reflected back up the drill string. This sacrifices the life of all the drill string components is a major contributor to hole deviation, increases wear and tear on drill rig components and results in higher operational costs overall. Top hammer button bits that are over-drilled exhibit broken buttons and impact drilling productivity.

BIT WEAR PATTERNS

Gauge Wear

If drilling through hard materials such as sandstone and quartzite, drilling with excessive rotation, the wear tends to be greater on the bit circumference. Thus, when the buttons are sharpened, the diameter across the gauge is less than or equal to the diameter of the bit body. In this situation, the bit tends to bind (gauge-out) in the hole. Drillers should consider bit replacement or restoring the gauge button-to-body gap to the original (new) condition.

Body Wash

When drilling in non-abrasive materials, carbide wear is minimized and drilling intervals are possibly longer. This allows for continued chip removal around the bit and wears away the bit body quicker than the carbides also referred to as body wash. Similar wear occurs in fractured and loose formations where constant hole cleaning and re-drilling of the materials is required for stabilizing the hole and to keep the hole open during retraction. To prevent button loss or shearing under these conditions, the protrusion should be reduced to the original height by scheduling grinding intervals.

Over Drilling

The detrimental effects of over drilling button bits may not be immediately apparent. However, running dull bits not only slows down drilling rates but escalates costs by reducing the life of the drill string components, the rock drill and the rig components. Premature button bit insert failures are substantially reduced when over drilling is eliminated and correct sharpening procedures are performed. Premature button bit insert failures are substantially reduced when over drilling is eliminated and correct sharpening procedures are performed.

PRODUCT SERVICING

Product Servicing - Button Bits

Large wear flats or the presence of snakeskin on the surfaces of buttons can lead to button failure. Similarly if the protrusion of the buttons above the level of the steel becomes reduced, penetration rates will drop and wear flats will develop rapidly. Under these conditions it is necessary to redress the bit to restore it, as near as possible, to its original geometry.

CARBIDE BUTTON WEAR GUIDE

Button Reshaping

If button protrusion is adequate, satisfactory resharpening can be achieved by use of a performed diamond faced tool. Sharpening is effected by holding the tool firmly against the button and orbiting the machine in a circle to achieve a uniform surface finish. Diamond faced tools are designed to cut carbide and not steel. It is therefore essential that ample protrusion of the button exists before the diamond tools are used.

Product Servicing - Blade Bits

Tungsten carbide blade bits are precision tools, manufactured from high-quality material and engineered to provide the best results during the most difficult drilling conditions. Tungsten carbide is resistant to shock and wear, and for maximum results should be properly used and maintained. When sharpening bits, the idea is to restore them as closely as possible to their 'tent' shape.

RECOMMENDATIONS

To get the most out of top hammer button bits, training drillers and mining management on bit care, maintenance and identifying excessive wear can increase the return on investment.

1. Inspect the Bit Frequently

Understanding the ground conditions and regular inspections of a button bit are necessary to prevent over drilling. To ensure optimal performance and life, bits require sharpening before the flat exceeds 1/3 of the button diameter. Working with a technical representative is recommended to establish specific guidelines since the maximum suggested wear before reshaping will depend on the button profile.

Drilling in non-abrasive ground can give rise to 'snakeskin' (small cracks) on the button surface. If it is not removed by grinding, button fatigue failure occurs.

2. Grind Protruding Inserts

Drilling in non-abrasive rock results in the bit face wearing faster than the inserts. Excessive insert protrusion, lacking sufficient steel support, can easily break while drilling and when retracting the bit from the hole. To prevent this from occurring, grind the buttons to restore the protrusion height.

3. Button Sharpening and Reshaping

If button protrusion is adequate, satisfactory re-sharpening can be achieved by use of a preformed diamond faced tool ('cups'). Sharpening is performed by holding the tool firmly against the button and orbiting the machine in a circle to achieve a uniform surface finish. Diamond faced tools are designed to cut carbide and not steel. It is therefore recommended to have enough protrusion of the button from the face to avoid damage to the cup, bit or grinding machine.

WARNING

NOTE: Use appropriate eye protection, masks and ventilation when grinding drilling bits. Grinding wheels and tungsten carbide inserts contain: Tungsten Carbide; Cobalt; Tantalum; Chromium; Nickel; Aluminum and Silicon. Grinding tungsten carbide inserts releases particles containing these elements that can irritate skin, eye, nose, throat and can result in lung damage.

WARRANTY

WARRANTY

Limited Warranty.

(a) Consumables. Boart Longyear warrants for a period of one (1) year after the date of shipment of the consumable products manufactured by it, or the performance of related services, under the Contract, that such consumable products are free from defects in materials and workmanship and such services are performed in a professional and workmanlike manner; provided, however, with respect to consumable products purchased through an authorized Boart Longyear distributor, the warranty period shall commence on the date of purchase by the end-user.

(b) Capital Equipment. Boart Longyear warrants that the capital equipment manufactured by it is free from defects in materials and workmanship for a period equal to the lesser of (i) one (1) year after the date of shipment, or (ii) the initial 1,000 operating hours. Boart Longyear warrants for a period of six (6) months after the performance of related services that such services are performed in a professional and workmanlike manner.

(c) General Terms. Boart Longyear further warrants that, to the extent applicable, as of the date of shipment or performance, all goods manufactured by it and services performed shall conform to the written specifications agreed between the parties. THIS IS BOART LONGYEAR'S ONLY WARRANTY. BOART LONGYEAR MAKES NO OTHER WARRANTY, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. As a condition to Boart Longyear's warranty obligations, Purchaser must: (i) contact Boart Longyear and request authorization to return any goods claimed to be defective promptly upon Purchaser's discovery of the alleged defect, (ii) upon receipt of an approved authorization code from Boart Longyear, return any goods claimed to be defective under the foregoing warranty, at Purchaser's expense, to the facility designated by Boart Longyear, and (iii) with respect to consumable products purchased through an authorized Boart Longyear distributor, the party making the warranty

claim must also deliver to Boart Longyear reasonable evidence of the date of purchase. Boart Longyear shall perform its examination of the goods so returned by Purchaser and shall report the results of its examination to Purchaser within thirty (30) days following its receipt of such goods from Purchaser, or, if longer time is required to complete such examination, within such time as would be required through the exercise of reasonable diligence. As a further condition to Boart Longyear's obligations hereunder for breach of warranty, Purchaser shall offer its reasonable cooperation and assist Boart Longyear in the course of Boart Longyear's review of any warranty claim. If requested by Purchaser, Boart Longyear will promptly repair or replace, at Boart Longyear's expense, goods that are confirmed to be non-conforming as a result of Boart Longyear's examination and according to Boart Longyear's warranty as set forth herein. All removal and installation of goods shall be at Purchaser's expense; provided, however, Boart Longyear will reimburse the Customer for an amount equal to the reasonable expenses incurred by the Customer and attributable to the removal and shipment of any defective goods. Boart Longyear reserves the right to reimburse Purchaser for an amount equal to the purchase price of any defective goods in lieu of providing repaired or replacement goods. Anything contained herein to the contrary notwithstanding, in no event shall Boart Longyear be liable for breach of warranty or otherwise in any manner whatsoever for: (i) normal wear and tear; (ii) corrosion, abrasion or erosion; (iii) any goods, components, parts, software or services which, following delivery or performance by Boart Longyear, has been subjected to accident, abuse, misapplication, modification, improper repair, alteration, improper installation or maintenance, neglect, or excessive operating conditions; (iv) defects resulting from Purchaser's specifications or designs or those of its contractors or subcontractors other than Boart Longyear; (v) defects associated with consumable parts or materials, the lifetime of which is shorter than the warranty period set forth in this Section; (vi) defects associated with

WARRANTY

Purchaser's specifications or designs or those of its contractors or subcontractors other than Boart Longyear; (vi) defects resulting from the manufacture, distribution, promotion or sale of Purchaser's own products; or (viii) accessories of any kind used by the Purchaser which are not manufactured by or approved by Boart Longyear.

(d) Sourced Goods. If the defective parts or components are not manufactured by Boart Longyear, the guarantee of the manufacturer of those defective parts or components is accepted by the Purchaser and is the only guarantee given to the Purchaser in respect of the defective parts or components. Boart Longyear agrees to assign to the Purchaser on request made by the Purchaser the benefit of any warranty or entitlement to the defective parts or components that the manufacturer has granted to Boart Longyear under any contract or by implication or operation of law to the extent that the benefit of any warranty or entitlement is assignable.

(e) Limitation on Liability. Except as provided for herein, in no event will Boart Longyear be liable for any indirect, incidental, special, consequential, punitive or similar damages including, but not limited to, lost profits, loss of data or business interruption losses. In no event will the total, aggregate liability of Boart Longyear under the Contract exceed the value of the Contract under which liability is claimed. The liability limitations shall apply even if Boart Longyear has been notified of the possibility or likelihood of such damages occurring and regardless of the form of action, whether in contract, negligence, strict liability, tort, products liability or otherwise. The parties agree that these limits of liability shall survive and continue in full force and effect despite any termination or expiration of any Contract. Any action by Purchaser against Boart Longyear must be commenced within one year after the cause of action has accrued. No employee or agent of Boart Longyear is authorized to make any warranty other than that which is specifically set forth herein. The provisions in any specification, brochure or chart issued by Boart Longyear are descriptive only and are not warranties.
